

ARSLAN QADRI

AI Technical Product Manager

Clinton, NJ 08809 | 908.627.2458 | thatqadri@gmail.com | qads.us | linkedin.com/in/maqadri

SUMMARY

AI Product Manager with 10 years of experience scaling machine learning products from 0-to-1 to enterprise production. Proven expertise in systematic, hypothesis-driven problem discovery, rigorous validation, and data-centric decision-making. Skilled at translating complex business objectives into concrete product requirements that drive and measure substantial business value. View portfolio work at qads.us

CORE COMPETENCIES

- **AI/Agentic Product:** Agentic AI systems, agent architecture & guardrails, RAG & retrieval evaluation, context engineering, LLM evals & observability, prompt injection defense, model attribution, 0-to-1 AI product delivery
- **Product Management:** Product strategy & discovery, roadmap ownership, user research, experimentation design (A/B testing), agile execution, cross-functional stakeholder alignment, GA/pilot delivery
- **Technical:** Python, SQL, Linux, LLM application development (Cursor, Claude Code), statistical & forecasting models, ML (XGBoost, Random Forest, decision trees, NLP, recommender/segmentation/propensity models)
- **Other:** Storytelling with data, hypothesis-based problem solving, AI ethics & responsible AI, measurement & analytics frameworks, campaign performance measurement, automation (Google Apps Script)

PROFESSIONAL EXPERIENCE

Verizon

Basking Ridge, NJ

AI Solutions Specialist – Commercial AI

01/2026 – Present

- Designed the measurement strategy for Verizon's new agentic chatbot, benchmarking it against the legacy system on active sessions, escalation, and containment rate. Found that measuring at the session level was masking true performance compared to a competitor's customer-level approach. Realigning the metric revealed a ~5-point containment improvement.
- Proactively built an offline evaluation framework to analyze escalated chatbot sessions, categorizing failures by type, intent, skill, and tool so engineering could prioritize fixes that actually improved containment.
- Designed and delivered three models for base management, including a product recommender, a perk upsell model, and a wireline to wireless cross-sell model, all used by marketing to power targeted campaigns.
- Automated cross-source reporting with Google Apps Script, cutting turnaround from a week-long reporting team cycle to under an hour.
- Connected model performance to campaign outcomes to clarify attribution within a McKinsey-led retention engagement that led to improving churn model precision by about 1%.
- Designed the initial architecture for a proactive anomaly-detection agent targeting activation failures, then handed off ownership to another team.
- Conceived and am currently pitching an LLM-powered market insight platform that combines KPIs, promotional history, and social sentiment with a simulation engine, helping marketing design value propositions in context of the competitive landscape. Unofficial POC at qads.us/marketsignal

Technical Product Manager – Sales Products

02/2022 – 12/2025

- Served as the de facto AI and product lead on Verizon's lead management platform. While a strategy PM held formal ownership, I independently mastered the system end to end, built data-backed business cases, and drove the roadmap decisions the formal owner ultimately committed to build, earning that trust through consistently data-grounded recommendations.
- Conceived and delivered the intelligent lead-prioritization framework that became this platform's flagship initiative, generating \$10M+ in incremental revenue in 2025 and continuing.
- Identified the lead-decay problem from Phase 1 field feedback and architected an inter-store reassignment solution (Phase 2), projecting a 3x conversion improvement. The program lost funding before results could be validated.
- Through direct user and stakeholder research, identified and delivered three additional use cases: call-transcript lead mining (2,000 hot leads/day), abandoned-browse detection (5,000 to 6,000 leads/day), and lead-context summaries (under 1% conversion lift).
- Also scoped and piloted several use cases that didn't clear the value bar, including abandoned-cart prioritization, time-to-call, and channel routing, and recommended against further investment, prioritizing evidence over sunk cost.

- On an earlier initiative in my first product role, built a retail "Digital Twin" simulation without early stakeholder validation. It saw no adoption and was folded into an existing program, a formative lesson in validating need before committing engineering resources that I've applied to every project since.

Principal Data Scientist – Consumer Acquisition

06/2019 – 01/2022

- Ran analysis guiding product lifecycle decisions for new launches including justKids, Mobile Mix & Match, and perks and offers, including the data that informed justKids' shutdown when it failed to generate sufficient adds and revenue.
- Investigated whether network quality metrics correlated with churn and gross adds and found negligible correlation, redirecting the org away from an assumed investment lever.
- Uncovered customers using tunneling methods to bypass mobile hotspot data limits, consuming up to 20x their permitted usage, a finding that fed directly into plan and policy updates.
- Automated prospect data mining and third-party data integration (Forrester, Meta, RootMetrics, Ookla) into a maintained research pipeline.
- Presented data-driven findings to leadership in biweekly executive reviews, including cases where the data contradicted assumed levers such as network quality and certain product bets.

Data Scientist – Churn and Base Management

02/2017 – 05/2019

- Solely built and owned a churn forecasting and alerting system, replacing a fully manual process (one person hand-tweaking forecasts and emailing them daily) with an automated Python pipeline covering **102 forecast levels** across geography, port-out carrier, and device, rolled into a single national view.
- Enhanced the system with rule-based, anomaly-detection-driven summaries, giving business users same-day deep-dive visibility instead of a static daily email.
- Automated churn-segment identification via explainable decision-tree models to inform targeted retention offers.
- Led team training on Python-based automation and data-warehouse-integrated reporting.
- Routinely provided ad hoc analysis to wireless leadership and marketing teams, delivering insights on customer behavior patterns and actionable recommendations to reduce churn and increase revenue

Infosys Technologies Limited

Mangalore, India

Senior Systems Engineer (Data Engineer)

06/2011 – 05/2015

- Operated as a generalist across automation, SQL-based data support, and ad hoc business problem-solving for international retail clients (Gap, Vodafone, JCPenney), using UNIX and PL/SQL to reduce manual effort in data cleanup and inventory processes.
- This hands-on exposure to data's role in business decisions was the direct catalyst for pursuing graduate study in analytics and the subsequent transition into data science.

SELECTED INDEPENDENT PROJECTS

- **Voice Mirror (iOS)** : AI voice-coaching app running entirely on-device (Phi-3.5 Mini, zero network calls), with a 3-agent producer critic architecture (Analyst → Writer → Inspector) measuring 9 real-time vocal metrics. ~70 users to date via organic content alone (no paid marketing); currently designing v2 retention mechanics (streaks/drills) based on observed usage patterns.
- **qads.us** : Personal portfolio with a custom RAG chatbot (FAISS + BM25 hybrid retrieval, cross-encoder re-ranking, GPT-4o-mini generation) grounded to minimize hallucination. After identifying prompt-injection attempts targeting API key extraction, implemented guardrails to harden the chatbot against adversarial input.
- **RefNet** : Two-sided referral marketplace with a credit-based, spam-resistant matching system; ~30 users via organic growth.
- **Personal Knowledge Pipeline**: Built an automated system that pulls in newsletters, podcasts, papers, and social media feeds, then summarizes them using the Gemini API's free daily limit at zero cost. Replaced a backlog of about 1,000 unread items with a distilled digest delivered straight to WhatsApp every hour.
- **Community Member Portal** : Google Apps Script portal for registration, profiles, and digital elections; used by ~200 families in a local community organization.

EDUCATION

University of Illinois, Urbana-Champaign

Stevens Institute of Technology

Narsee Monjee Institute of Management Studies (NMIMS)

MBA, Marketing and Strategy, 2024

MS, Business Intelligence and Analytics, 2016

B.Tech, Computer Science, 2011
